

SEWING BRASILIA

BUILDING SECTION

- Residential use
- Corporate use
- Green areas

Faced with the issue of the dominance of vehicular traffic in the city of Brasília, an elevated passageway over the current highway is proposed. This corridor aims to become a large green space, incorporating new recreational functions for the city and hybrid buildings that facilitate their integration into the urban fabric.

The design features circular planters of varying sizes, accompanied by urban amenities.

The project aspires to make this corridor a major urban catalyst in the future, connecting the city like the branches of a tree, fostering closer ties with both preexisting buildings and those introduced in the proposal.

The spaces beneath the elevated passageway are occupied by green areas and leisure zones.
